REVIEW

Update on the Obesity Epidemic: After the Sudden Rise, Is the Upward **Trajectory Beginning to Flatten?**

Obesity

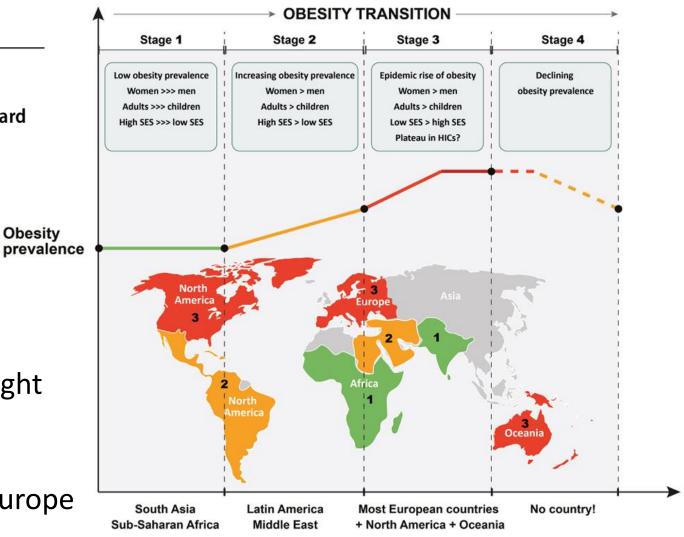

Chrysi Koliaki¹ · Maria Dalamaga² · Stavros Liatis¹

Obesity is global health priority, rising prevalence:

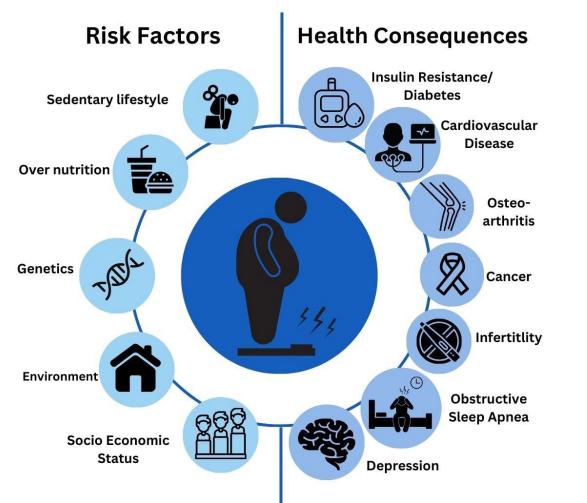

- tripled since 1975
- > 2/3 of the US population are over-weight
- 23% of adults in the Europe
- Overweight + obesity \rightarrow 60% adults in Europe

5.1.0.08

PALAZZO DEL CASINÒ/HDO DI VENEZIA

Economic development

Pathogenesis of obesity :

- genetic,
- epigenetic,
- developmental and environmental factors,
- increased energy consumption,
- reduced physical activity (not only)

Bariatric surgery is still the most effective treatment option reduce body weight,

- decrease CVD mortality by 30%
- increase the overall life expectancy by 3 years

According to the nine guidelines a **MULTIDISCIPLINARY TEAM** should be used to manage overweight and obesity as a long-term, chronic disease

LIFESTYLE INTERVENTIONS

Intensive lifestyle and behavioural interventions \rightarrow

7–10% mean weight loss over 52 weeks in clinical trials

• INCREASED PHYSICAL ACTIVITY:

should be individualized to patients' capabilities and preferences The **American College of Sports Medicine (ACSM)** recommended that individuals need to exercise :

- 150–250 min/week, prevent weight gain
- 150–250 min/week, achieve weight loss
- 200–300 min/week, maintain weight loss,
- BEHAVIOURAL INTERVENTIONS :
- motivational interviewing
- stimulus control
- cognitive restructuring
- selfmonitoring essential part

LIFESTYLE INTERVENTIONS

• LOW-CALORIE BALANCED DIET:

dietary interventions should be individualized and based on personal and cultural preferences

The recommended therapeutic goal \rightarrow

weight loss of 0.2 -1.0 kg per week and a 5-10% reduction in body weight

- Weight-loss programme referrals for adults in primary care (WRAP)
- The Diabetes Remission Clinical Trial (DiRECT)

strict weight management program for 12 month \rightarrow 825–853 kcal/day formula diet for 3–5 months,

- weight loss of **15 kg** or more in 24%
- diabetes remission in 46%
- in the control group no patient achieved a weight loss of>15 kg, (only 4% of patients achieved diabetes remission)

PHARMACOLOGICAL TREATMENT

The use of **anti-obesity medications** in conjunction with **lifestyle interventions** is indicated for

- PEOPLE WITH OBESITY (BMI ≥30 KG/M²)
- OVERWEIGHT (BMI ≥27 KG/M²) with at least ONE WEIGHT-RELATED HEALTH CONDITION

FDA-Approved Weight Loss Drugs 1999 2012 2007 Xenical Qsymia Alli (phentermine-topiramate) (orlistat) (orlistat) 2014 2014 Saxenda Contrave (bupropion-naltrexone) (liraglutide) 2020 2023 2021 Imcivree Zepbound Wegovy (setmelanotide) (tirzepatide) (semaglutide) verywell health

Anti-obesity medications approved for long-term weight management :

- Orlistat*→ inactivates gastric and pancreatic lipase, leading to the excretion of up to 30–35% of ingested fat
- Phentermine
- Naltrexone-bupropiont
- Liraglutide 3.0 mg
- Semaglutide 2.4 mg
- Tirzepatide

- regulate food intake,
- to reduce hunger,
- promote satiation,
- reduce food reward

effects on diverse neurotransmitters in CNS pathways

SJ.C.OB

PALAZZO DEL CASINO/HDC

(including the hypothalamic melanocortin system and mesolimbic reward system)

LIRAGLUTIDE AND SEMAGLUTIDE

GLP-1 analogue.

Initially prescribed for the management of type 2 diabetes, both central and peripheral action:

- inhibition of glucagon secretion,
- increase in insulin secretion → in a glucose- dependent manner → reducing the risk of associated hypoglycaemia
- decreases the rate of gastric emptying.
- **promote satiety**, acting on receptors within the arcuate nucleus in the hypothalamus and nucleus of the solitary tract

LIRAGLUTIDE

- similar to the native GLP-1 sequence \rightarrow few chemical modifications to *improve bioavailability* and *extend the half-life*, (replacing lysine at position 34 with arginine and adding a C16 fatty acid at the ε -amino group of lysine at position 26.9)
- The once-daily 3.0 mg liraglutide has been approved by the Food and Drug Administration (FDA) and European Medicines Agency (EMA) for the treatment of obesity.

SEMAGLUTIDE

- analogue of liraglutide with a substitution of alanine with an aminoisobutyric acid (Aib) at the 2nd position in the N-terminal. The C16 fatty acid is also exchanged for C18 fatty acid and linked by a synthetic spacer.
- The half-life of semaglutide extends to 160 h, supporting **once-weekly administration**.
- Semaglutide once-weekly 2.4 mg was approved by the FDA in June 2021 for the treatment of overweight/obese individuals.

REVIEW

Efficacy and Safety of Liraglutide and Semaglutide on Weight Loss in People with Obesity or Overweight: A Systematic Review

Zeyu Xie®, Sensen Yang®, Weishang Deng®, Jinjian Li, Jisheng Chen®

Weight Loss

- semaglutide 2.4mg (MD=-12.47kg, 95% CI [-13.25, -11.69]), best weight loss effect semaglutide 2.4mg (OR = 1.29, 95% CI [0.97, 1.71], P > 0.05)
- liraglutide 3.0mg (MD=-5.24kg, 95% CI [-5.82, -4.67]),
- semaglutide 1.0mg (MD=-3.74kg, 95% CI [-4.87, -2.61]),
- liraglutide 1.8mg (MD=-3.29kg, 95%Cl [-4.04, -2.53]).

Decreased HbA1c (%)

- semaglutide 2.4mg (MD= -1.48%, 95% CI [-1.93, -1.04]), best-decreased HbA1c (%)
- semaglutide 1.0mg (MD=-1.36%, 95% CI [-1.72, -1.01]),
- liraglutide 1.8mg (MD= -1.23%, 95%Cl [-1.66, -0.80]),

There is no significant difference in the comparison between semaglutide 2.4mg and semaglutide 1.0mg and liraglutide 1.8mg

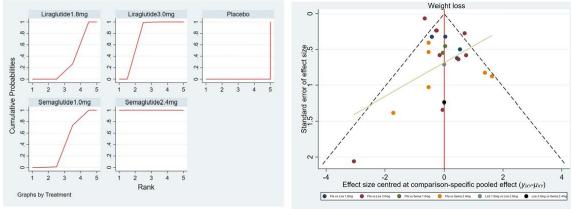

Total Adverse Events

- semaglutide 2.4 mg (OR = 2.36, 95%Cl [1.84, 3.03], P < 0.05),
- Liraglutide 3.0 mg (OR = 2.35, 95%Cl [1.82, 3.02], P < 0.05),

semaglutide 1.0 mg had the lowest incidence of total adverse events, semaglutide 2.4 mg had the highest incidence of total adverse events

Serious Adverse Events

liraglutide 3.0mg (OR = 1.47, 95%Cl [1.07, 2.02], P < 0.05). Liraglutide 1.8mg (OR = 1.67, 95%Cl [0.68,4.09], P > 0.05), semaglutide 2.4mg (OR = 1.29, 95%Cl [0.97,1.71], P > 0.05) semaglutide 1.0mg (OR = 0.87, 95%Cl [0.54,1.39], P > 0.05) NO significant difference

Effect of semaglutide and liraglutide in individuals with obesity or overweight without diabetes: a systematic review

You Deng 🝺, Andrew Park, Lin Zhu, Wen Xie 🝺 and Calvin Q. Pan

the liraglutide 3.0 mg daily treated group,

- > 5% weight loss → 48.2% to 76.1% vs 1.8% to 44.0% in CG.
- ≥ 10% → 20% to 46% vs 1.8% to 26%
- ≥ 15% → 8.4% to 28% vs 1.8% to 12%

In semaglutide treated groups,

- > 5% → 86.4% to 88.7% vs 31.5% to 47.6%,
- >10% → 69.1% to 79.0% vs 12.0% to 27.0%,
- > **15%** → 50.5% to **63.7%** vs 4.9% to 13.2%

All populations treated with liraglutide or semaglutide were associated with **effective**, **sustained**, **clinically relevant weight loss** regardless of the study design and duration

Randomized clinical trial exercise combined with liraglutide \rightarrow twice as much as either treatment alone in reducing the body weight and body-fat percentage.

It was also associated with the improvements:

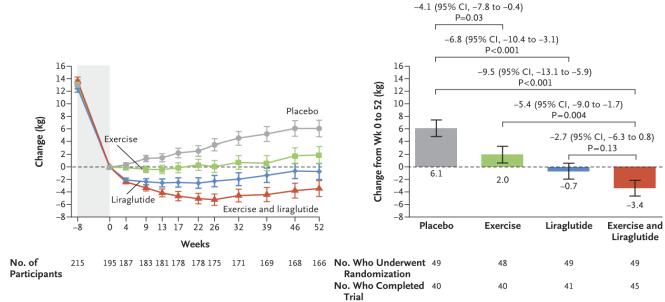

- insulin sensitivity,
- cardiorespiratory fitness,
- maintaining a good mood

A Change in Body Weight

10-

TIRZEPATIDE

In May 2022, the hypoglycemic drug tirzepatide (trade name: Mounjaro) developed by Eli Lilly and Company was approved by the FDA for marketing. **First dual agonist of glucose dependent insulinotropic peptide (GIP) and GLP-1 receptor**, which is used as a subcutaneous injection once a week

GIP

- inhibits gastric secretion activity,
- stimulates insulin secretion, has insulin-like effects on adipose tissue,
- inhibits fat lysis,
- promotes fat generation

Diabetes Ther https://doi.org/10.1007/s13300-020-00981-0

REVIEW

The Role of Tirzepatide, Dual GIP and GLP-1 Receptor Agonist, in the Management of Type 2 Diabetes: The SURPASS Clinical Trials

Thinzar Min 💿 · Stephen C. Bain

GLP-1

- stimulate insulin secretion
- inhibit the release of glucagon.
- slow down gastric emptying
- induce a feeling of fullness

Both GIP and GLP-1 belong to the insulin stimulating hormone \rightarrow stimulating hormones may be caused by nutrients in the gut, microbial factors, and neuroendocrine stimulation. GLP-1 inhibits glucagon while GIP increases, which may produce a **good balance for avoiding hypoglycemia**

GIP and GLP-1 lead to **increased insulin secretion** and **peripheral insulin sensitivity**, while **slowing the neuroregulation of gastric emptying** and gastrointestinal motility

Clinical Trial > Lancet. 2023 Aug 19;402(10402):613-626. doi: 10.1016/S0140-6736(23)01200-X. Epub 2023 Jun 26.

Tirzepatide once weekly for the treatment of obesity in people with type 2 diabetes (SURMOUNT-2): a double-blind, randomised, multicentre, placebocontrolled, phase 3 trial

W Timothy Garvey ¹, Juan P Frias ², Ania M Jastreboff ³, Carel W le Roux ⁴, Naveed Sattar ⁵, Diego Aizenberg ⁶, Huzhang Mao ⁷, Shuyu Zhang ⁷, Nadia N Ahmad ⁷, Mathijs C Bunck ⁷, Imane Benabbad ⁷, Xiaotian M Zhang ⁷; SURMOUNT-2 investigators

BMI 27 kg/m2 or higher and **type 2 diabetes** treated with tirzepatide for 72 weeks 938 participants \rightarrow tirzepatide 10 mg (n=312), tirzepatide 15 mg (n=311), or placebo

Tirzepatide (or matching placebo) was initiated at 2.5 mg once weekly and increased by 2.5 mg every 4 weeks until the target dose was reached

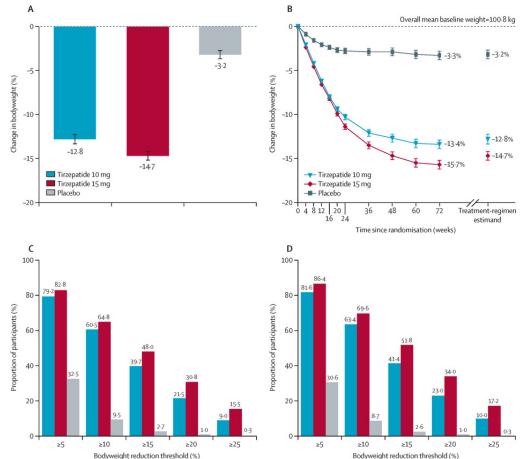

At week 72 bodyweight was

- -12.8% (SE 0.6) or -12.9 kg (-28.4 lbs) with tirzepatide 10 mg,
- -14.7% (SE 0.5) or -14.8 kg (-32.6 lbs) with tirzepatide 15 mg, →
 >79-83% reaching a weight reduction of 5% or more
- -3.2% (SE 0.5) or -3.2 kg (-7.0 lbs) with placebo

On tirzepatide 15 mg, bodyweight reductions at week 72

- > 65%, → 10%
- 48%, → 15%
- 31% → 20%

Improvements in **fasting serum glucose**, **fasting insulin**, and **seven-point SMBG profiles** were also greater among participants treated with tirzepatide compared with placebo

gastrointestinal disorders (diarrhoea, nausea, and vomiting)

Tirzepatide as a novel effective and safe strategy for treating obesity: a systematic review and metaanalysis of randomized controlled trials

Wenting Cai $^{1\ 2}$, Ruobin Zhang $^{1\ 2}$, Yao Yao 2 , Qiuhui Wu 2 , Jinping Zhang 2

Affiliations + expand PMID: 38356942 PMCID: PMC10864442 DOI: 10.3389/fpubh.2024.1277113

Tirzepatide group had **lower BMI than the control group** [MD = -1.71, 95% CI (-2.46, -0.95), p < 0.00001].

The tirzepatide group has a more outstanding advantage in **weight loss \geq15%** compared to weight loss \geq 5 and 10%.

Compared with placebo, the efficacy rate of tirzepatide in **weight loss≥20%, 25% was much higher than that of placebo** [RR = 30.43, 95% CI (19.56, 47.33), p < 0.00

The results showed that the waist circumference of the tirzepatide group was significantly lower

INTRAGRASTIC BALLOON

The **IGB** is a **temporary restrictive technique**

a balloon is inflated with air or fluid and endoscopically placed in the patient's stomach for up to 3–6 months.

Several studies have demonstrated substantial weight-loss outcomes \rightarrow satisfactory performance profile for incorporation into clinical practice guidelines

Saline soution is injected to fill the ballion Uninflated balloon the is removements balance is files

Piggerwrit of Intragaetric balloon.

Weight reduction from IGB appears to be temporary and unsustainable in the long run

The total pooled *complication rate* was 8.13% (95% CI: 4.04–13.17%)

- mild (grades I–II) complications was 0.65% (95% CI: 0.00–2.71%)
- severe complications (grades III–V) was 5.45% (95% CI:1.94– 10.12%)

REVIEW

Intragastric Balloon as Bridging Therapy Prior to Bariatric Surgery for Patients with Severe Obesity (BMI \ge 50 kg/m²): a Systematic Review and Meta-analysis

Jing Hong Loo¹ · Yao Hui Lim¹ · Hwee Ling Seah¹ · Andrew Zhi Quan Chong² · Kon Voi Tay^{2,3}

Received: 17 July 2021 / Revised: 15 October 2021 / Accepted: 3 November 2021 / Published online: 17 November 2021 © The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature 2021

Bridging with IGB therapy achieved a weighted pooled BMI reduction of 6.60 kg/m² (MD=6.60, 95% CI: 5.06– 8.15; I2=72%) prior to bariatric surgery

ig. 1 Pooled change in body mass index (BMI) before and after intragastric gastric (IGB)

Check fo

Efficacy of Intragastric Balloon versus Liraglutide as Bridge to Surgery in Super-Obese Patients

Gennaro Martines ¹, Agnese Dezi ¹, Carlo Giove ¹, Valerio Lantone ¹, Maria Tersa Rotelli ¹, Arcangelo Picciariello ¹, Giovanni Tomasicchio ¹

Affiliations + expand PMID: 37579738 PMCID: PMC10601677 DOI: 10.1159/000531459

The group treated with IGB reported:

- a significant difference in weight (125 kg, IQR 119–130 vs.
 136.5 kg, IQR 125.5–154.5; p < 0.05)
- BMI (47.24 kg/m², IQR 46.2–48.9 vs. 53.6 kg/m², IQR47.7–55.8; p < 0.391)

compared to liraglutide group.

```
The median %EWL (15.5, IQR 13–18.7 vs. 6.71, IQR 5.8–7.4;
p < 0.05)
median %EBWL (28.5, IQR 24.8–33.07 vs. 11.8, IQR 10.3–14.3;
p < 0.05)
were significantly higher in IGB group when compared to
liraglutide group
```

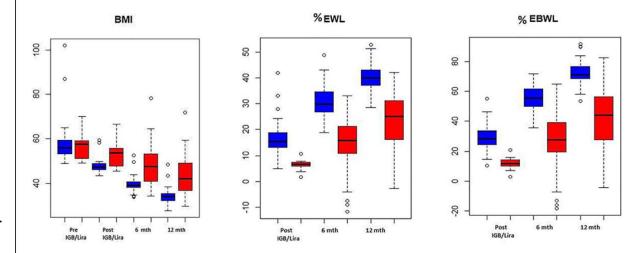

Fig. 2. Relationship between intragastric balloon (IGB) (with blue) and liraglutide (Lira) (with red) management and body mass index (BMI), percent excess weight loss (%EWL), and percent excess body weight loss (%EBWL) at 6 and 12 months.

There were **no differences recorded** between the two groups concerning postoperative complications according to Clavien-Dindo grade

BMI between 30 and 40 kg/m² and follow-up 12 months
ESG vs LSG
%EWL → 62% vs 80%
LSG showed moderate superiority over ESG.

ESG is less invasive and preferred for patients with class I or II obesity

WEIGHT REGAIN

The literature lacks a clear consensus on how to define weight regain, described as:

a regain of 10% to 25% of excess weight or total weight loss recovery from the lowest weight achieved loss.

Up to **20%** of bariatric patients experience weight regain or fail to achieve long-term weight loss \rightarrow undermines the long-term benefits of the metabolic surgery

Individuals with poor weight loss or weight regain have:

- increased appetite
- unfavorable postoperative gut hormone profile → lower circulating GLP-1 levels.

Treatment with GLP-1 analogs may therefore benefit people with poor post-surgery weight

Revisional surgery is an invasive with even higher complication rate than that of a primary procedure

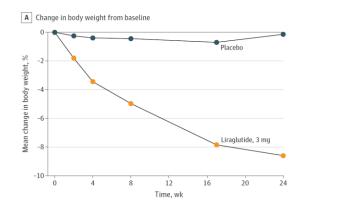

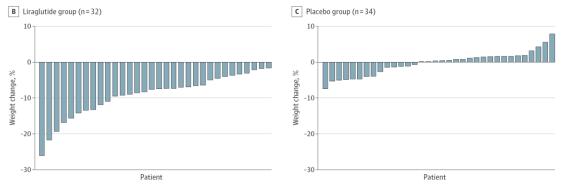

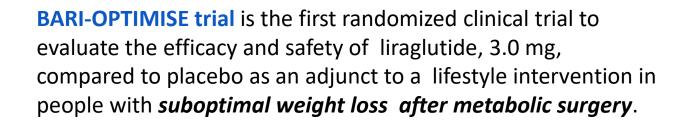

JAMA Surgery | Original Investigation

Safety and Efficacy of Liraglutide, 3.0 mg, Once Daily vs Placebo in Patients With Poor Weight Loss Following Metabolic Surgery The BARI-OPTIMISE Randomized Clinical Trial

Jessica Mok, BMBS, MPhil; Mariam O. Adeleke, PhD; Adrian Brown, PhD; Cormac G. Magee, MBBChir, MA; Chloe Firman, MRes; Christwishes Makahamadze, MRes; Friedrich C. Jassil, PhD; Parastou Marvasti, PhD; Alisia Carnemolla, PhD; Kalpana Devalia, MBBS, MS; Naim Fakih, MD; Mohamed Elkalaawy, MRCSEd, MS, MD; Andrea Pucci, MD, PhD; Andrew Jenkinson, MBBS, MS; Marco Adamo, MD; Rumana Z. Omar, PhD; Rachel L. Batterham, MBBS, PhD; Janine Makaronidis, MBChB, PhD

liraglutide, 3.0 mg, for 24weeks \rightarrow

- reduction in percentage body weight, -8.03 (95% CI,10.39 to -5.66)
- Body weight (-8.82 [4.94] vs -0.54 [3.32]; P < .001)
- reduced fat mass,
- favorable changes in cardiometabolic risk factors,
- improvement in health-related quality of life.

in the liraglutide group compared to the placebo group lost 5% or more of their body weight (71.9% vs 8.8%)
